
Subject: Question about Dataminer syntax to execute Stored Procedure

Greetings,

I'm trying to execute a SQLserver stored procedure which invokes a Bulk Insert (for speed) to load data but despite looking at the DM documentation am unable to get it to work!

Here's the code

```
sql_statement="{CALL LoadDAOcat("
sql_statement+=string(Meta(k).daocat_filename)+","
sql_statement+=string(Meta(k).image)+")}"
oDB->ExecuteSQL,sql_statement
```

which builds the following SQL statement

```
{CALL LoadDAOcat('v:\processed
\HST_9293_06_ACS_WFC_F814W_daophot_v1.0.txt','HST_9293_06_AC S_WFC_F814W')}
```

The procedure requires 2 parameters (data file name and a value to identify which db entry to update)

The syntax appears to be ok according to the on-line docs but I get the following error

```
IDLDBDATABASE::EXECUTESQL: ODBC [Microsoft][ODBC SQL Server Driver]
[SQL Server]68921
Execution halted at: HLAREADDDATA    435
```

Error 68921 doesn't appear anywhere in the ITT, DataDirect or MS documentation that I can find so I can't even figure out what the error is???

Anyone able to help?

Thanks in advance....

-Brian
