Noah,

here's my attempt. It accepts only scalar inputs for A and B, while Z can be a vector. I've tested it for the examples on the mathematica site and it seems to give correct results, and works correctly for complex input too as far as I can tell. 'Precision' is an input variable to specify how close two successive iterations have to be before the function assumes they are the same and aborts the while loop. Default is 7 (i.e. stop when results differ by 10^-7 or less). If you're finding this programme is running very slow, try decreasing the precision (I was surprised how fast it runs despite the while loop, actually!)

Ideally the input parameters should all be double precision before you make the call to the function, but the function converts them if they're not.

If you want all your inputs to be vectors (not just Z), I'm sure it can be done, but it'd be a bit more complicated. :-)

Take care, Chris

Noah,

Here is my implementation, both of the series expansion of the hypergeometric function and the integral representation. Depending on the parameters, I have found that one may be more stable than the other. Both of these are based on Arfken and Weber, Mathematical Methods for Physicists.

```
best,
dan
; chss
 confluent hypergeometric series solution
 calculates the solution to the differential equation:
 xy''(x) + (c - x)y'(x) - ay(x) = 0
 (see Afken and Weber, p. 801-2)
; inputs:
; n: number of terms to calculate. Due limits in IDL architecture n
must be between 1 and 170.
 a, c: vector of constants - see above. They MUST have the same
number of elelments
  x: input value
 outputs:
  y: output vector
; Dan Larson, 2007.10.11
function chss, n, a, c, x
  y = DBLARR((SIZE(a))[1])
  ; first term of series expansion is 1, so we initialize the output
  y[*] = 1
  FOR i = 0, (SIZE(a))[1]-1 DO BEGIN
    ; initialize constant series products
    a_p = 1
    c_p = 1
    FOR i = 0, n DO BEGIN
     a_p *= (a[i] + j)
     c_p *= (c[i] + j)
     d = FACTORIAL(j + 1)
     y[i] += (a_p/c_p)^*(x^(j + 1))/d
    ENDFOR
  ENDFOR
  RETURN, y
```

**END** 

```
; chins
; confluent hypergeometric integral solution
   calculates the solution to the differential equation:
       xy''(x) + (c - x)y'(x) - ay(x) = 0
   (see Afken and Weber, p. 801-2)
   inputs:
       a, c: vector constants - see above
       x: input value
   outputs:
       y: output vector
;Dan larson, 2007.10.11
Function chins, a, c, x
        ; curve point resolution, change this if your results look like
crap
        b = 1000
        ; initialize t vector
       t = DINDGEN(b + 1)/b
        ; initialize vector of curve heights
        h = DBLARR(b + 1)
        ; initialize output
       y=dblarr(n_elements(c))
        g1 = GAMMA(c)
        g2 = GAMMA(a) * GAMMA(c - a)
        FOR i = 0, (SIZE(a))[1]-1 DO BEGIN
               FOR j = 0, b DO BEGIN
                  h[j] = \exp(x^*t[j]) * ((t[j])^(a[i] - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) * ((1.0 - 1.0)) *

Thank you all for your answers. It really made my day!
I've tested the 3 methods for the "Mathematica" example (i.e. for
1F1(1,2,[-5..5]))
HYPERGEOMETRICONEFONE, CHSS and CHINS seem to work fine for this
example. HYPERGEOMETRICONEFONE seems a bit faster than the other ones.
Unfortunately I am more interested in evaluating something like 1F1(-.
75,1,40):
IDL> print, hypergeometricone (-0.75D, 1D, -40D)
       NaN
IDL> print, chins([-0.75D],[1D],-40D)
       NaN
```

IDL> print, chss(169D,[-0.75D],[1D],-40D) 17.478776

The mathematica website gives [http://functions.wolfram.com/webMathematica/FunctionEvaluation.jsp?name=Hypergeometric1F1]:

Thanks, Noah
