This happens (frequently, it seems to me) when IDL exits in an unorthodox manner. There are two processes you need to kill. I don't remember the names of them off-hand, but they are pretty easy to find. One has "idl" in the name, and the other has "java". I just use "ps -a" to find them.

Cheers,

David

Thank you for the response,

I will try the same and will post the updates.

Regards,
Kishan.
