Hello,

I need some tips about handling large arrays in IDL. The size of the arrays is around (100000 x 100000) and the general error messages are "array contains too many elements" or "cannot allocate memory". One way to get around the problem is to create many smaller arrays but I would like to keep this option as the last one. The RAM size of the server is 8GB, probably it is maximum that can fit into the machine. I would be grateful to have suggestions from you.

Thank you.

Regards,
Vijay
