Hi,

I am using idl 6.1 and have just upgraded the os to 10.5.2 (from 10.4)
- I am using a Powerbook g4 aluminum 15" 1.5 GHz

When try to start idlde I get the followong error message:
"The Process has forked and you cannot use this corefoundation
functionality___ you must exec___() to debug"
and then nothing happens the command line too seems to work though
(which usually don't use).

Any hints how I can solve this issue?

Thanks,
Phil
