Hi all,

I have a little trouble with integrating a dlm file:
The dlm file and the related dll are both located in a folder which has been added to the !path. This folder is also set as working directory in the preferences > startup. But when I try to compile a procedure using a function from this dlm I get a syntax error at the first call of this function. I always have to register the dlm by hand with DLM_register, afterwards everything works fine. Anyone can give me a hint what could be the problem?

OS is WinXP, IDL version 6.3

Thanx in advance,
Justus
