Subject: array.FIELD reading ascii file - ERROR message??? Posted by matthias.demuzere on Mon, 05 May 2008 11:42:50 GMT

Hi All,

Like always, I read in my ascii (.txt) files as follows:

input = file.txt'
res = read\_ascii(input,
DELIMITER=' ',DATA\_START=1,MISSING\_VALUE=-9999)

This is working when checking with the print, res statement.

Now, I always extract columns from this file, while using the following statement year = reform(res.field01(0,\*)) or year = reform(res.field(0,\*))

As I am not completely sure how this FIELD statement is working, I was hoping on some help? Because in this case, I get the following ERROR message:

% Tag name FIELD01 is undefined for structure < Anonymous>.

And I have no idea why? Normally, if I have this message, I change from field 01 to field, and than it works. This time, it doesn't.

Could anybody help me with this? Thanks,

Regards, Matthias
