Hi,

I have an iTool (two surfaces, a line, a legend, and axes) saved as a .isv. I restored it by invoking an "empty" isurface and then using File > Open etc. It restores beautifully, but I have hot one little snag. I am unable to export any of the data elements to an IDL variable. I can select the item I want to export via the File > Export dialogs, but after a while the "Next >>" button is desensitized and - bonk - I'm stuck.

I should say that I am able to export it to a file and work from there, but that is a pain in the backside. I realize that at IDL 6.3 I'm a little out of date, but I would love to be able to get data in an iTool into an IDL variable quickly.

Any suggestions on how to fix this bugger? I have posted a snapshot of the dialog window...

Thanks and cheers,

Ben
