Hi,

I am writing a Data Reduction GUI software in IDL. I wanted to be able to call another useful package thats already there (ATV.pro) from the GUI for quick analysis. So I did that. But a problem I ran into is ATV modifies the color table. This messes up all my colors in the GUI that I wrote. I tried using tvlct, rr,gg,bb,\get and loading it back. This didnt work either. In my GUI I dont load colortables or do anything to them. Instead I just use the color keyword for each colors. If anyone could help me out I would be internally grateful:). Thanks
