Hi all,
   I have written some IDL code(I am still very much a beginner) that
reads in some text files, narrows some parameters down in the file,
then prints it out as a postscript file. All this works fine, but
each time I want to use a different text file I have to manually
change the directory path in my code to point to the new file. What I
would like to do is design a simple gui which has a menu where the
user can just choose the directory path to the desired file, then
press another button and have it graph the selected text file using my
previous code.
   What is the easiest way to go about this? I am using IDL 7 right
now as well.
Thanks,
Charles
