I'm guessing that the "event loop" is only activated for the the widget hierarchy rooted at the top-level base used to register the program with XMANAGER. So, for example, I can make this program run in separate windows if I also register the draw widget top-level base with XMANAGER.

xmanager, 'test', root, /no_block is ~Keyword_Set(one) then xmanager, 'test', drawroot, /no_block

Note that I had to add the modification only to make this work in IDL 6.4 on Windows. It ran without modification and worked perfectly in my IDL 7.0.3 installation. Score one for the Workbench!

Cheers,

David

P.S. If you are keeping score, it is IDL Workbench 1, IDL 6.4 4529.
