Hi people,

Is it difficult to launch a JAVA application from IDL? I want to do that and maybe someone can help me with a code example.

I have a JAVA applet and I want to run it with IDL code.

Thanks,

Bernat

Hi Bernat,

It depends upon the application. Most Java programs can be started as a java.applet.Applet in a web browser or a java.awt.Frame as standalone. Running a Java program as standalone can be done using the Java Bridge very easily. If you must use an applet then there is probably a way to invoke appletviewer over the Java Bridge. Another method may be to embed Internet Explorer using Active X and put your applet in the web page.
