Folks,

Can't someone please do something about the fact that RESOLVE_ALL should be re-named RESOLVE_ALMOST_ALL.

I pretty much don't write an IDL program that is not an object of some sort, and I can't even begin to describe what a pain in the patooie it is to get an IDL save file that will run on the Virtual Machine from one of my programs. Mostly because RESOLVE_ALL doesn't have a clue about objects. (I know there is a CLASS keyword, but my point is, why should *I* have to know about all the damn objects I am using. I'm using nothing *but* objects!)

Wouldn't it be simpler to fix the damn program than to listen to customers rant every time they want to do something that should be so simple?

Oh, never mind. I always get like this when the wife brews hazelnut coffee in the morning. :-(

Cheers,

David
