Some good news for co-sufferer of IDL X11 on Macses

There is a new version of X11 with much less faults, at least on my Macses:

<http://xquartz.macosforge.org/trac/wiki/X112.3.0>

With idl 7.0 and Mac OS X 5.4 I have now at least no mouse problems anymore (PPC and intel). The left and the right button did not function properly.

Still there is a problem with the closing of windows from window manager (sometimes idl crashes with lost X connection)!

Regards
Karsten
