| Hello!

|

| I have recently switched to linux (Ubuntu 8.0) and installed IDL(v7.0)
| using all default settings. I am experiencing following problem with
| help system.

|

| whenever I seek help using command "?" or click on menu "help-> Help
| Content", IDL opens firefox but only error page displayed stating
| "while trying to retrieve the URL: http://127.0.0.1: ...connection
| refused". But if I start idlde with super user privilege, help is
| displayed normally.

|

| It appears to me more a linux problem than IDL problem, but for me it
| is happening while using IDL and in case anyone has experienced similar
| problem before, can throw light on it.

|

| Thanking you in advance

|

| PV

which port is it using ? the number after the :

cheers

The number keeps on changing for each idlde session to session. For today, the first time it was 59308, for the second time it was 59786 and the third time it was 62936.

One more thing in context of my first message; when I ran idlde using command > sudo idlde, help command first displayed error message "firefox not responding...". At this I closed already open firefox window and on next "? function name" command, help was properly displayed. But after ending the idlde session, when I restarted firefox, I noticed that it was corrupt and can only be run properly after creating new firefox user profile.

Thanks.

PV
