
Subject: heap_free fatal error

Hi all,

I'm struggling with an IDL fatal error after calling heap_free. The argument is a rather complex structure (hence the use of heap_free). I started using ptr_free on some of the fields before the heap_free call, but no luck so far (the structure is complex, so maybe I missed some).

Did anyone observed heap_free crashing the IDL process and what was the cause in your case?

I'm working on a WinXP 64-bit machine

IDL> print,!version

```
{ x86_64 Win32 Windows Microsoft Windows 7.0 Oct 25 2007    64 64}
```

Tried also with the 32bit version

```
{ x86 Win32 Windows Microsoft Windows 7.0 Oct 25 2007    32    64}
```

Thanks,

Wout
