Hi,

I was having a problem while I tried to launch IDL Workbench or Help window. My problem was with libxul and while I am at loading screen I was getting hotspot java virtual machine error.

I am a beginner in in Linux ( I use RHEL 5.2) and also new in IDL. It took me a couple of hours to resolve these issues. Finally I get rid of the bug by uninstalling xulrunner and I had to install Firefox 3.0 (it was a dependent file to xulrunner) It works fine but I downgraded my Firefox to v1.5.something. I think either producer of Xulrunner or IDL should release a patch about this problem.

I think for your case, best case would to ask a direct help from the IDL people.

We have released a patch for this issue that is discussed in IDL Tech Tip 4395 XULRunner patch for IDL 7.0:

<http://www.ittvis.com/services/techtip.asp?db=INT&ttid=4395>

The Tech Tip describes the issue and provides a link where you can download the patch.

My apologies, the correct link to access this patch is:

<http://www.ittvis.com/services/techtip.asp?ttid=4395>

Sorry for the confusion.

Bill
