Dear group,

I've just installed IDL 7.0 on a Mac OS X Server. Users connect to it using ssh, and X11 forwarding is enabled.

The problem is that the default web browser Mac OS X uses is Safari, and it uses Aqua libraries, which can't be exported. I've installed a different web browser which is able to be executed from an X11 environment (links -g), but I don't know how to change the default web browser where the help is shown.

We are not using "idlde" (eclipse) nor "idlhelp", but the "?" inside an IDL prompt (executed using "idl" from a terminal).

Any ideas?

Thanks in advance.
