
Subject: Dumping plots to dummy output?

I have a program that does plots and calculations. Sometimes I just want the calculations. Is there a way to set the plot output to some dummy variable so that it will go faster than when actually plotting (by plotting to nothing)? I could comment out all the plot statements, but there are a lot of them and it would be a pain. Right now I'm setting output to 'PS' to speed things up a little, but is there a faster way?
