Folks,

Another Mac question. Somehow I got the IDL Workbench behind the "Apple" bar at the top. Now I can't move the darn thing, or even close it. I have the same problem when the program gets resized and the resizing point on the lower-right of the window goes behind the application icons on the bottom. How to cope?

Thanks,

David

P.S. Of course, the Workbench knows where it is suppose to come up now, so it's, uh, sort of useless to me. :-(

Another solution exists if you're using Spaces in 10.5: The F8 key will bring up the overview of your 'spaces' and at that point you can drag a window around to your heart's content. I do this all the time when the top of a window gets stuck under the menu bar, which happens when I shift between different configurations of monitors with my laptop.
