Hello,

at first I wanted to try out the command line arguments of the idl virtual machine in combination with a simple summation program, just to test it out...

PRO test_sav

```
cla = command_line_args(count = count)
```

```
a = cla[0]
```

```
b = cla[1]
```

```
c = a + b
```

```
header = string(c)
```

```
file = filepath('test.txt', root_dir='d:')
```

```
  OpenW, lun3, file, /Get_Lun
```

```
    PrintF, lun3, header
```

```
  Free_Lun, lun3
```

END
