Subject: Widget tree bug Posted by Robbie on Tue, 25 Nov 2008 22:15:24 GMT View Forum Message <> Reply to Message

Hi,

I've been using widget\_tree() to allow a user to choose different pages in an application. I've used widget\_tree() because I need an icon or graphic to display the state of the page.

http://sites.google.com/a/barnett.id.au/interactive-workshop /Home/bugs/widget\_tree\_bug.bmp

There appears to be an intermittent problem where the user clicks on an item but the tree node doesn't become selected. Instead, the clicked node is outlined and the user must click again to fully select the tree node.

It is only on the second click that a WIDGET\_TREE\_SEL event is generated.

The bug has been replicated on IDL 6.1 on Windows XP. In unix and macosx the user sometimes has to press the spacebar to actually get a tree node selected.

Does anyone know about this bug? Does it sound like an application problem rather than an IDL bug?

**Thanks** 

Robbie
