Hi,

I've been using `widget_tree()` to allow a user to choose different pages in an application. I've used `widget_tree()` because I need an icon or graphic to display the state of the page.

[http://sites.google.com/a/barnett.id.au/interactive-workshop /Home/bugs/widget_tree_bug.bmp](http://sites.google.com/a/barnett.id.au/interactive-workshop/Home/bugs/widget_tree_bug.bmp)

There appears to be an intermittent problem where the user clicks on an item but the tree node doesn't become selected. Instead, the clicked node is outlined and the user must click again to fully select the tree node.

It is only on the second click that a `WIDGET_TREE_SEL` event is generated.

The bug has been replicated on IDL 6.1 on Windows XP. In unix and macosx the user sometimes has to press the spacebar to actually get a tree node selected.

Does anyone know about this bug? Does it sound like an application problem rather than an IDL bug?

Thanks

Robbie
