Hi, there

I got an array X which having 152 elements, and I want to use some wavelet methods to remove noise (abnormal elements), Here is my code in IDL

```
;;//////////////////////////////////// //
;;generate array X with 152 elements
X=[...]

;;get information of specific wavelet (DAUBECHIES)
information=WV_FN_DAUBECHIES(8,scaling,wavelet,ioff,joff)

;;define stop level
nl=3

;;perform wavelet transformation
xdwt = vv_dwt(X,scaling,wavelet,ioff,joff,n_levels=nl)    ;;-----
here is the error source

;; denoise
newdwt=vv_denoise(xdwt,'DAUBECHIES',3)

;;inverse wavelet transform
idwt = vv_dwt(newdwt,scaling,wvx,ioff,joff,N_LEVELS=nl,INVERSE=1)
help,idwt
print,'idwt is',idwt
;;//////////////////////////////////// //
```

The error information is:

WV_DWT: Input array dimensions must be less than 4 or a power of 2.

Can anybody here tell me the reason why this happened? and how can it be solved?

Thanks

Hu
