Hi all,

I am trying to run a code to deal with 1200 CDF files. However, some of them are not good files. When I use certain CDF commands to open or read them. IDL will return a error message and stop running. Now the problem is I have so many files. And I do not know which are good, which are bad. They all look the same size. But I can only tell when the code stop running. Therefore, I have to rerun the code again after deleting the bad file it picked out. So is there any command in IDL which could tell whether a CDF file is good or not. The important feature is that it can return results based on the judge. And it will not stop a program from running.

Thanks in advance.

Sincerely
