I am currently using PvWave for a satellite imaging program. One of the things we do is use the save command to save an image and use the restore to bring it back and view it again with the tv command. here is the PROBLEM: it seems almost random that sometimes when we restore the image and tv to display it, it is reversed and sometimes it is not. when it is reversed we must do a reverse(image,2) to bring it back to normal. Why does this seem almost random? how can this be prevented?? thanks for the help we are very confused.
