
Subject: file_search: need work around for filenames with square brackets []

Hi,

the routines for reading FITS-files in the IDL astro library use file_search() internally. Now I want to read a file name with square brackets (as this "[" and " this"]") in it, but file_search seems to interpret the square brackets as regular expression. Is there a way to escape the brackets?

Other suggestions?

I don't really want to change the library routines not rename the files I have to read.

Any ideas?

Thank you very much,

RK
