
Subject: IDL 7.1 workbench: auto text match?

Hi all,

Just upgraded to IDL 7.1 on my Windows machine, and on editing my first code in this environment I encountered what must be a new feature of the workbench ,, if I click on a word, IDL searches the editor for matching words and highlights them. I imagine this is useful for finding all instances of a variable, function, procedure, etc, but in my case I am working with large files (several thousand lines), which means each time I click somewhere there is a perceptible (~1 second) delay while the text is searched. This is driving me nuts, and I can't figure out how to turn it off. Any ideas?

Thanks!
