On Windows systems, you turn on the Show Window Contents While Dragging option from the Display Properties -> Appearance -> Effects dialog. There is probably something similar for X Windows.

But, believe me, it is only something you *think* you want. :-)

Cheers.

David

Thanks,

As a matter of fact, that's not what I want, by the way I am using the Windows system.

Actually, I need to redraw the contents while I am dragging(with button unrelease) the top level base, the redraw and dragging should be *concurrent*. But in fact, the widget base generates the resize events only *after* I stop dragging and release the button.
