
Subject: for each loop in hashtable

Hi,

I am using 2 hashtables in my IDL program as:

```
fileList ( id , data )  
    id is a string value and data is a 2D array  
colorList ( id , color )  
    id is the same string and color is an integer
```

Now I want to do this:

for each id of colorList which exists in fileList, plot the data with the "color". I mean for each string "id" get the "data" from fileList and get the "color" from colorList and plot the data in that colour.

Do you have any idea how to do this?

Thank you
