Hi,

I have 2 hashtables in my IDL program. one is called fileList which has (id , data) as its (key, value) and second one is colorList (id , color). I want to define a "foreach" loop so that for each id of colorList which exists in fileList, it plots the data with the "color". I mean for each string "id" get the "data" from fileList and get the "color" from colorList and plot the data in that colour.

Can anybody help me with this please.

Thank you
