Maybe I don't understand what you want, but to extract the first
12bits from a 32bit integer:

```
a=54564L  
b=a and 'FFF'xl
```

Please ignore this, I've solved the problem by writing to a temporary
file, opening it using readu as a byte array with four times as many
lines, reading the needed bytes and allowing the values I need through
an 'if' statement.

Apologies,

Edward

For the record (in case somebody needs that):

```
IDL> x=2LL^45+2LL^35+2LL^32+2LL^31+2LL^25+2LL^15+2LL^5-1 & print,x  
35225207865375
```

```
;get only 32 bits
```

```
IDL> a=string(ulong(x),format='(B)') & print,a  
100000100000000001000000000011111
```

```
;get all bits
```

```
IDL> a=string(x,format='(B)') & print,a
```

1000000000100110000010000000001000000000011111

Ciao,
Paolo

Hi Edward,

Compile the function below and run it through ENVI Band math and it will return an 0/1 map of the bit position that you specify. So for retrieving bit position 7 (integer value 128) use:

```
cgi_map_bitwise_flag(b1, 7)
```

with best regards,

Allard

```
FUNCTION cgi_map_bitwise_flag, statusmap, bitposition  
  return, BYTE((statusmap AND (2UL^bitposition))/(2UL^bitposition))  
END
```
