
Subject: HDF: accessing VData in VGroup

Hello together,

I am struggeling with reading VData from a VGroup in an HDF4-File
(CloudSat-Data).

I get the number of entries in the VGroup by HDF_VG_GETINFO and then
try to loop over all entries.

From there on it is not clear to me how to get first the IDs of the
group and then to retrieve attributes and data.

I tried using HDF_VD_GetID and HDF_VD_ATTACH but it is not clear to me
how to derive the IDs of the VData from the VGroup.

Thanks for your help in advance !

Klemens
