```
% Execution halted at: SUBROUTINE 105
  /users/hyer/idlpro/papers/mod04_aeronet_land/pro_20091103/
regress_rmse_vs_a
  od.pro
%           $MAIN$           48
  /users/hyer/idlpro/papers/mod04_aeronet_land/pro_20091103/
figure_rmse_by_ao
  d.pro
```

IDL gives me this information, at the console, when it stops because of an error condition. Is there any way I can get at it programmatically? In other words, is there a system variable where IDL stores the information of what routine it's running and where it is?

Thanks,

--Edward H.
