Ah, the passion and fire of youth!

Here are the steps.

1. Subclass your 3D Viewer object from IDLitComponent.
2. Create GetProperty and SetProperty methods for your objects "color" property.
3. Register your "color" property using the RegisterProperty method of your object (from IDLitComponent). Set its "type" to "COLOR".
4. Write a property sheet for your object using the PropertySheet widget.

That's it. Done. Finished.

Do let us know how this program goes!

Cheers,

David

Hi David,

I find the way la~

Thank you very much~

While I need sometime to gets that implemented, I will let you know when the skeleton is finished.

And if you have time, please give me some advices.

Thank you really very much for your help~

Cheers,

Ray
