Subject: Program caused arithmetic error: Floating illegal operand

Grrr....I'm pretty annoyed with IDL right now. This may be the last
straw for the day but I thought I'd see if I could get some help. I
know which two lines of codes are causing this error. The funniest
part of it is, THERE ARE NO ZEROS! I've printed out all of the lists
that I'm dividing by. There are no zeros (my data doesn't even cross
the axes for the section I'm running the code on). I even checked the
variables that I'm writing the division to, and it has all real
numbers, no NaN or anything. So, I was wondering if anybody has any
other ideas why this error pops up? My computer has crashed several
times in the process of trying to sort this out and mostly I just walk
away until its done running so the overload of text doesn't crash me :(
