
Subject: IDL without X11?

Hi guys,

I'm trying to run a program as a script in a remote machine. The problem I've is related to X11.

Actually, my program doesn't display anything (widgets, etc) but there are some definitions that I can't delete.

For example: `a=WIDGET_BASE()`

If I try to run this command on a session without X, IDL returns me the following error:

X11 connection rejected because of wrong authentication.
X connection to localhost:10.0 broken (explicit kill or server shutdown).

So my question is if there is a way to run IDL without X ?

Or, if you are good using Linux, how can I activate the X before the command

`idl -rt=program_script.sav -args A B C`

and how can i deactivate after ?
