Good morning to the group,

I was recently in need for some quick 3D visualization, so I gave the iTools a shot. I got what I wanted with a reasonable amount of effort but I encountered many quirky things along the way. I hope many will go away with the new IDL 8 plotting system. However, one particular problem was particularly annoying: When I set breakpoints or stops in my code for debugging purposes, the iTools window would stop refreshing and responding to my clicks. Is there a setting to prevent this behavior?

Cheers,  
Haje
