
Subject: IDL make_dll and unresolved externals

Hi,
I am trying to use the call_external for C code and am using make_dll to compile the dll. The problem I am having is with the make_dll. I am including another library (opencv) in the c code and it seems to compile okay when I just declare a (opencv type) variable from that library. But when I include a call of any one of the functions from the (opencv) library in the code, there is unresolved external compiler error on it.

Any suggestions on what I am doing incorrectly? Can other libraries like opencv be used for IDL?

Additional info-
I am using windows os, the cl compiler, and the latest IDL.
The adjustments I have made to the default make_dll call were adding the include files and .lib files of the other library (opencv).
