Hello,

I am trying to access a complete array with the '*' wildcard but it will only work with scalar values. The range ':' option will not work either.

I think it should be possible if I dereference is with the '(' ')' brackets??

What am I doing wrong here?

```
print, mean( (*( *pState).navtrack)[0]).lat ) ;;works!
```

but....,

```
print, mean( (*( *pState).navtrack)[*]).lat )
```

```
% Expression must be a scalar in this context: <POINTER Array[2]>.
```
