---

Hi,

I have discovered a "bug" in one of my codes but the problem is that it works apparently without problems with it. I have the following line:

```
PV_theta(lathetafix2,*,*,esafecha2),lonparadibujar,latparadi  
bujar,levels=PV_fixed(pvu),close=0,path_xy=xy,path_info=info ,/  
path_data_coords
```

I use close=0 because I am dealing with contours not closed, but the problem is that according the documentation it is closed=0

why does it work? I don't get any error or warning message.

I am using IDL 6.4
