Hi, There,

I am using idl-shell.el version 1.19 that I ftped from esrg.ucsb.edu. The behavior is definitely different under IDL 4.0 and IDL 3.6. It works very well under IDL 3.6 that I can set breakpoints, clear break points and when a problem, or break point is reached, the idl program will stop at the line automatically. This, however, doesn't seem to work with IDL 4.0. I can still set breakpoints, but IDL always complain about not knowing where the breakpoint is when I set them, although it stops there anyway. I cannot clear the breakpoints by control keys either, have to list the breakpoint and clear it by breakpoint command. Is this a common problem, or is it something I need to set in my .emacs or UNIX environment? Can someone familiar with the interface between emacs and idl give me a hand? BTW, I am using emacs 19.28.1 on an HP 735 running HP-UX 9.01, if it matters. Many thanks in advance.

Guan
