Subject: [Q] idl/idl-shell mode has problem with IDL 4.0

Hi, There,

   I am using idl-shell.el version 1.19 that I ftped from
esrg.ucsb.edu. The behavior is definitely different under IDL 4.0 and
IDL 3.6. It works very well under IDL 3.6 that I can set breakpoints,
clear break points and when a problem, or break point is reached, the
idl program will stop at the line automatically. This, however,
doesn't seem to work with IDL 4.0. I can still set breakpoints, but
IDL always complain about not knowing where the breakpoint is when I
set them, although it stops there anyway. I cannot clear the
breakpoints by control keys either, have to list the breakpoint and
clear it by breakpoint command. Is this a common problem, or is it
something I need to set in my .emacs or UNIX environment? Can someone
familiar with the interface between emacs and idl give me a hand?
BTW, I am using emacs 19.28.1 on an HP 735 running HP-UX 9.01, if it
matters.   Many thanks in advance.

Guan
