This comes pretty close to a minimum set of commands:

```
;setup coordinates
x=findgen(512)/511*4-2
xx=x#(x*0+1)
zz=complex(xx,transpose(xx))
cc=zz

;compute set for n=100 iterations
niter=100
for i=0,niter-1 do zz=zz*zz+cc
```

```
inside=where(abs(zz) LE 2,complement=outside)
```

```
;this just for display  
mand=xx*0  
mand[inside]=1  
tv scl,mand
```

Ciao,
Paolo

Any help with KOCH curve?

what have you tried? how did it fail?

Paolo

I just want to know how we could produce it (KOCH curve) in IDL.
Dave
