Hi,

I am having fits data, im reading it in this way. img=readfits('file.fit',h)

Now if I do print,h it prints the header a=avg(img(0:1023,0:1023),1); im averaging over 1024 rows writefits,'file1.fit',a,h; im writing into fits file

Now if I do print,h it prints the header were the COMMENT(the header consists of 8 arrays out of which one array contains comment info) part of the header of the original(file.fit) is different from the one(file1.fit) which I got now.

Is there any way to retain all arrays of the header same before and after writing to a new fits file. regards sid
