I use main-level programs as a place to start or to place an example at
the end of a file containing regular routines. Anything more complex
than a few lines should be in a function/procedure. But the nice part is
that it is easy to just add the "pro/function my_routine, a, b, etc.."
line at the top of the main-level program to change it into a routine.
After coding and getting something working, 99+% of what gets committed
and kept is in regular routines.
