Dear All,  
I am looking for pre-made routine or programming tips to get intersection. I would like to calculate intersection from given two positions(A and B)

If we know Latitude and Longitude of Point-A and Point-B, also the azimuth angles of Point-A and Point-B from the North. if azimuth angles is not parallel, those two lines will be cross. This triangulation mathematics looks simple. however it is not easy to make code. How do I calculate this intersection point (cross point) precisely? or Is there any pre-made routine?

Sincerely Yours  
B.J.Kuk
