Hi guys,

Is it possible to communicate 2 PCs via a socket ?

I have an internal network and I just want to make 2 computers communicate with each other in order to have control for 1 program.

My initial idea is to open a socket and read and write from these 2 different computers. Reading the documentation I see "The SOCKET procedure opens a client-side TCP/IP Internet socket as an IDL file unit" so I don't know if I can do what I want.

I'm using Windows, anykind of help is appreciated...

nata
