Caveat: I've not used that NG function much yet... I would bet that even if you use TARGET to link to a PLOT(), it may not map your VERT\_COLORS to the colorbar since the mapping between real data value and color is completely arbitrary.

However, you can create your own ticks with values using the TICK\* keywords though. Have you tried that yet? Tacking on to the example in the help guide for COLORBAR, I did this:

```
IDL> c.major = 3  
IDL> c.tickname = string([0, 0.5, 1])
```

to change the number and labels of the colorbar.

mh

That's the answer! So easy when it's explained!  
Many thanks,

David
