
Subject: a question regarding idl path

Hi all.

I sometimes run idl on a server where the same installation is shared by several other users.

Is there a way to get the system to search for *.pro files in a set of folders _without_ changing the !path system variable? (Changing !path would also change it for all other sessions that other users might open subsequently)

I basically want to be able to use procedures not necessarily located in the working directory without changing !path for anyone other than myself

The IDL version is 7.0, and it's under a unix environment.

Sincerely
Søren Frimann
